Engineering Reference Document | Owner: Ali Raza, DevOps | Reviewed by: Faisal Rehman | Version 1.4

Deployment Processes

1. Environments

Environment	Purpose	Deploy Trigger
Development	Feature branches, local testing	Manual, per developer
Staging	Integration testing, QA sign-off	Automatic on merge to main
Production	Live client-facing environment	Manual, tagged release + DevOps approval

2. Production Deployment Approval

All production deployments for AWS-hosted projects (NovaCart, MedLink) require sign-off from the DevOps team — Ali Raza or Waleed Anjum — confirming infrastructure readiness, rollback plan, and monitoring coverage before a release is promoted from staging.

3. Deployment Checklist

- All tests pass in CI (GitHub Actions) on the release branch.
- QA sign-off obtained (Noor Fatima for MedLink; project QA lead for other projects).
- Database migrations reviewed and reversible.
- Rollback plan documented in the release ticket.
- DevOps approval logged (Ali Raza / Waleed Anjum) before promotion to production.

4. Rollback Procedure

In the event of a failed production deployment, the on-call DevOps engineer reverts to the previous tagged release via the CI/CD pipeline and notifies the project Team Lead and Engineering Manager (Faisal Rehman) within 15 minutes of detection.

5. Project-Specific Notes

Project	Deployment Notes
NovaCart	AWS ECS Fargate; blue-green deployment for zero-downtime releases

MedLink	AWS EC2; requires additional security review for patient-data-handling changes
FinTrack	Maintenance mode only — hotfix deploys require Ali Raza's direct approval
EduSphere	Deployment pipeline not yet established; planned before Q1 2026 kickoff
