

AgileTech Studio

Engineering Reference Document | Last Updated: July 2026 | Owner: Zainab Qureshi, Head of Engineering

Technology Stack

1. Overview

This document describes the standard technology stack approved for use across AgileTech Studio's client projects. All Engineering teams are expected to select from these approved technologies unless an exception is granted by the Head of Engineering.

2. Approved Technologies by Category

Category	Approved Technologies	Typical Use Case
Backend	Python (FastAPI, Django, Flask), Node.js (Express)	APIs, business logic, services
Frontend	React, Vue.js, TypeScript	Web application interfaces
Mobile	React Native	Cross-platform iOS/Android apps
Database	PostgreSQL, MongoDB	Relational and document data storage
DevOps & Cloud	Docker, AWS (EC2, S3, RDS), GitHub Actions	Deployment, hosting, CI/CD

3. Stack by Active Project

Project	Backend	Frontend/Mobile	Database	Cloud
NovaCart	Python / FastAPI	React	PostgreSQL	AWS
MedLink	Node.js	React Native	MongoDB	AWS
FinTrack	Django	Vue.js	PostgreSQL	Docker
EduSphere	Python / Flask	React	PostgreSQL	AWS (planned)

4. Notes

FinTrack was delivered on the Vue.js/Django stack and is now in maintenance mode following project completion in February 2025. Newer projects (NovaCart, MedLink, EduSphere) standardize on Python and React/React Native per the current Engineering Guidelines.
